Methodology & Business Insights

Understanding the assumptions, calculations and key findings behind Nexora Group's AI investment analysis · January–June 2027

Key Business Insights

- *Overall ROI: The estimated labour capacity value of **£6,473.75** is below total AI investment of **£17,306.09**, resulting in an estimated ROI of **-62.59%**.*
- *Department performance: Marketing has the strongest departmental ROI at **-28.21%**, while Sales has the weakest at **-92.76%**.*
- *Productivity: AI-assisted work accounts for **82.81%** of recorded tasks, with an estimated **280.07 hours** saved.*
- *Usage concentration: Customer Support generates the highest AI request volume, accounting for **29.89%** of requests.*
- *Output quality: Non-AI-assisted tasks have higher success and acceptance rates in this dataset. This is an observed association, not evidence that AI caused the difference.*

ROI Calculation

- *Total AI Investment: Token costs + operating costs.*
- *Estimated Benefit: Labour capacity value generated from recorded work outcomes.*
- *Net Estimated Value: **Estimated labour capacity value − total AI investment**.*
- *AI ROI: **(Net estimated value ÷ total AI investment) × 100**.*
- *Value per £1 Spent: Estimated labour capacity value ÷ total AI investment.*

Operating Cost Allocation

- *Direct departmental costs are assigned to the department that incurred them.*
- *Shared operating costs **(£9,000)** are allocated across the five operating departments based on each department's share of total AI requests.*
- *This allocation method assumes that AI request volume is a reasonable proxy for shared infrastructure and implementation usage.*
- *Total company ROI includes the full shared operating costs once, avoiding double counting.1*

Data Scope & Limitations

- *Reporting period: **January–June 2027**, covering six months of simulated business activity.*
- *Dataset: **10,000** work items and **13,647 AI requests** across five operating departments.*
- *Business context: Nexora Group is a fictional organization. All records and financial figures are synthetically generated for analytical demonstration.*
- *Measurement: Productivity benefits are estimates based on recorded time saved and hourly labour costs.*
- *Attribution: The analysis does not establish that AI alone caused changes in productivity, quality or task outcomes.*
- *Cost allocation: Shared costs are distributed using departmental AI request share, which is an allocation assumption rather than a direct measurement of*
